

DOES YOUR BEST CUSTOMER  
LET YOU KNOW HIS BUILDING  
IS WITHOUT AIR CONDITIONING

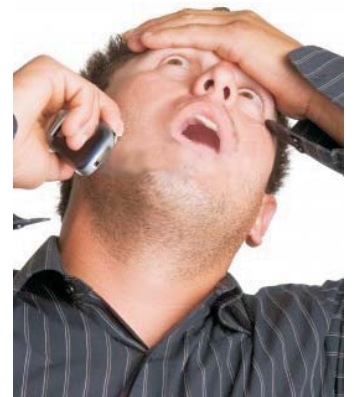

OR

WILL HIS AIR CONDITIONER  
WARN YOU OF PROBLEMS?

## IT CAN TALK TO YOU!!

It can tell you that the inlet pressure is too high or the outlet pressure is too low and is probably low on Freon. It can tell you the motor is running 30 degrees above ambient temperature and it is about to seize. It can tell you that the air flow is reduced. With information like this, you could head off the problem before it became a real problem.

## AND IT IS WIRELESS.

It does not use a service that charges monthly fees and calls you. Instead, it sends a text message direct to your cell phone(s) and advises you of changing conditions. This means that you can send a service man when it is more convenient to you and not when all your men are out on service calls.

## IT IS THE TBOX

The Tbox is a remote wireless monitor that upon detecting changes in external sensors will text message any person's cell phone. It accepts 4 digital inputs (contact closure) and 2 analog inputs (0-20 mA or 0-5 vdc). The contact closure can be a pressure switch that you select. Or it could be an air pressure switch. The analog input could be connected to a differential thermistor to compare cooled air to ambient air. If they are equal, the unit is not working. A simple relay will tell the control when the AC unit is cooling. With one input it can text message a series of warnings as the temperature differences decreases. In addition to messages, the Tbox can transfer up to 4 relay contacts when alarms are triggered.

## ACCESSORIES

The Tbox is an industrial wireless alarm monitor and contains 4 heavy duty form C relays (DPST) rated at 7 Amps at 240 volts. It has provisions for DIN mounting. As an accessory, a 24 volt power supply and NEMA 4 enclosure is available. Both a single thermistor and a dual differential thermistor is available.
