

A WIRELESS ALARM MONITOR THAT YOU PROGRAM, THROUGH LOGIC TO TRANSFER RELAYS OR TEXT MESSAGE A CELL PHONE.

TYPICAL WIRELESS ALARM SYSTEM

The standard Wireless Alarm Monitor is a control that accepts the input from sensors and through wireless technology sends a signal to a GSM/GPRS Network advising that an intruder, fire or other emergency condition exists. The message is forwarded on to an Operations Center. This then will pass on real time alerts to cell phones or E-mails, allowing remote systems access through the WEB. It also sends the information to a Central Monitoring Service. They in turn gives notification to police, firemen or other emergency personnel.

YOU MAY NOT WANT A BURGLAR ALARM

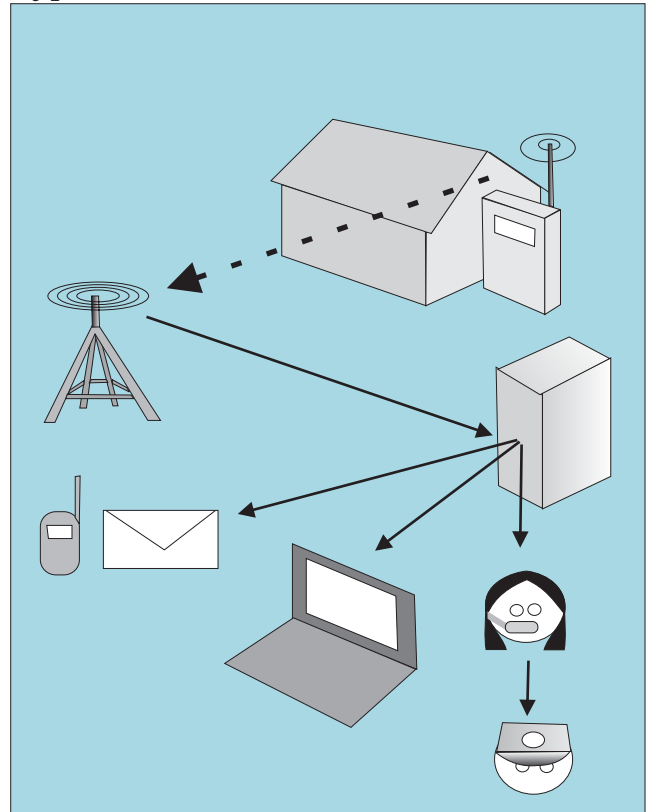

The Tbox is a Wireless Alarm Monitor and Control. The sensors are programmed for the application to determine the course of action when triggered. The application could require several inputs to produce an output. The output can be either a relay transfer and/ or a text message sent to one or more cell phones. The signal is sent to the GSM/GPRS Network and then directly to the cell phones or e-mail. There is no middle Operations Center or costly Central Monitoring Station. The Tbox accepts 4 digital inputs and 2 Analog Inputs. It has 4 SPDT 7 Amp Relays.

A time function is included as part of the programming logic. An event may be repeated based on time to happen from seconds to months, week days or specific shifts. Only the appropriate party on a specific shift may receive the text message. Evening messages can be different than daytime for the same event

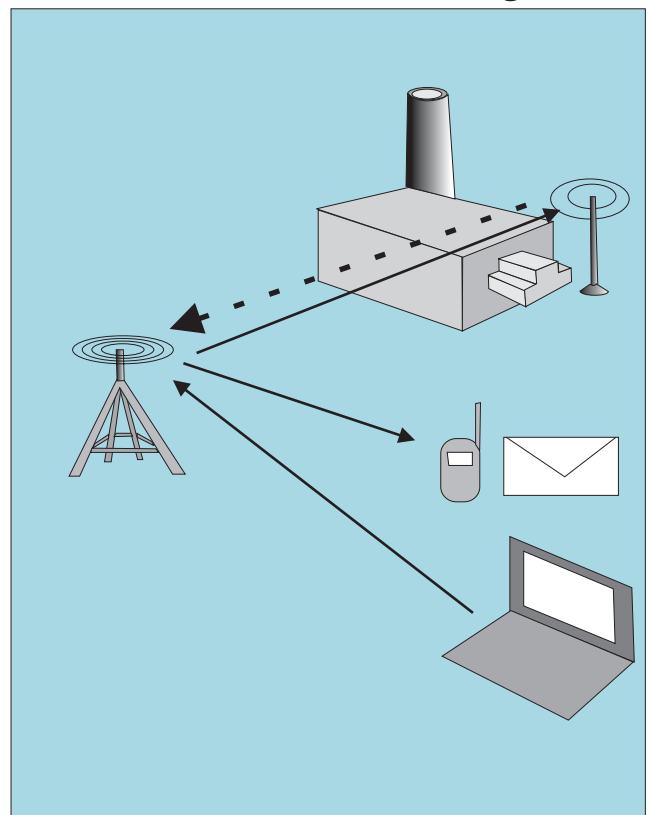

The Tbox can be programmed by either a personal computer via RS-232 or by the GSM/GPRS Network. This means that when remotely installed, you can use a PC to change any parameters as well as read the status of all inputs (analog and digital) as well as outputs.

General Packet Radio Service (**GPRS**) is a packet oriented Mobile Data Service available to users of Global Systems for Mobile Communications (**GSM**).
